## HYSPEEDKOTE

### Watercraft efficiency treatment We've broken a barrier!

For decades, manufacturers have attempted to develop marine paints and coatings that increase the efficiency of water craft. Their success has been limited at best.

### Waxes, sealers and silicones do not increase performance.

Waxes and sealants that many boaters apply to enhance performance, or those contained in gel coat as part of the mould release process, are actually counterproductive. These water repelling coatings create a "dry" surface that only increases drag.

### A dry hull moving in and out of the water slows a vessel down each time it re-enters the water.

This sticking effect occurs continuously, especially when the vessel goes temporarily airborne from wave action, making for the typical rough ride you experience upon re-entry.

### Hydrophobic vs. Hydrophilic

To understand Hyspeedkote's performance benefits, you need to understand the difference between **hydrophobic applications**, like waxes and silicones, **repel water**, **hydrophilic coatings attract water**. Gel coat, for example, is naturally hydrophobic.

### Nature's demonstration of hydrophilic effect is a fish.

When a fish is pulled from the water a layer of that water continues to surround its body. That's why it can leap out of your hands so easily. The hydrophilic effect is a major reason why fish glide through and in and out of water so effortlessly.

### Hyspeedkote™ will do the same for your hull and other underwater surfaces, regardless of their composition, configuration, or size!

#### Coverage

Spray can 207 ml 9 m2.  
Spray can 414 ml 18,5 m2.

#### Prices

Spray can 207 ml Euro 58,40 excl. VAT  
Spray can 414 ml Euro 92,02 excl. VAT  
Prices are excluding VAT 19% and excluding shipping.

**Hyspeedkote™ is on stock at  
African Cats B.V.**
